EXPERIMENT

Title

SUM OF NUMBERS AT PRIME FACTORS

Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is: $p^a \times q^b \times r^c \times .... \times z^f$,where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is: a x arr[p] + b x arr[q] + c x arr[r] +...... + f x arr[z].

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

Input Format:

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

$6 = 2^1 \times 3^1$

sum=1*arr[2]+1*arr[3]=1*32+1*45=77

Source Code:

```
def prime_factors(n):
    factors = {}
    # Check for number of 2s that divide n
    count = 0
    while n % 2 == 0:
        n //= 2
        count += 1
    if count > 0:
        factors[2] = count

    # n must be odd at this point, so we can skip even numbers
    for i in range(3, int(n**0.5) + 1, 2):
        count = 0
        while n % i == 0:
            n //= i
            count += 1
        if count > 0:
            factors[i] = count

    # This condition is to check if n is a prime number greater than 2
    if n > 2:
        factors[n] = 1

    return factors

def calculate_sum(arr, num):
    if not arr:
        return -1

    factors = prime_factors(num)
    total_sum = 0
    found_index = False

    for prime, power in factors.items():
        index = prime
        if 0 <= index < len(arr):
            total_sum += power * arr[index]
            found_index = True

    if not found_index:
        return 0

    return total_sum

# Input reading
import sys
input = sys.stdin.read
data = input().strip().splitlines()

n = int(data[0])
arr = list(map(int, data[1].split())) if n > 0 else []
num = int(data[2])

# Calculate and print the result
result = calculate_sum(arr, num)
print(result)
```
